*Basic fertilizers are to be used on the medium soil until the 4th week of flowering only every second watering. In hydroponics systems, the use of our N-P-K containing products also requires constant circulation of the nutrient solution and its surface (circulation pump and bio-filter). For automatic plants, the basic fertiliser should be increased again by approx. 30-50%...to reduce. **Booster/stimulators are excluded from the reduction and can be used without hesitation with every casting process. can be applied with up to 5 ml/l each. ***Only as required, or 1-2 times in the week before last together with pH powder apply. ****For optimal nutrient availability we recommend a constant pH value between 5.8-6.2 [Hydro] and 6.0-6.5 [Earth]. PH powder lowers the pH value of the nutrient solution quickly and effectively. *****Living Organics brings especially in the selective cultivation methods, the naturally occurring positive properties of a healthy and intact microflora, and a significant improvement in soil life in all substrates and growing media. *****On the medium cocos, in airpots, LED light spectrum, pH-values below 5.8 the additional application of our product Organic CalMag is recommended.
